

Dear Parent/Caregiver

Science learning involves observing natural phenomena around us and attaching meaning to it.

There are many scientific processes that happening when a candle is a burning. To us it is just a normal everyday occurrence, but a whole world of science learning opportunity to learners.

In this activity, allow learners to;

- Write** down their observations
- Explain** in their own word what they see happening to the candle.
- Relate** some of their observations to some of the concepts taught at school
- Identify** the three states on matter the candle goes through whilst burning
- Attempt to **explain** why the wick keeps burning

“There is no better, there is no more open door by which you can enter into the study of science than by considering the physical phenomena of a candle.” Michael Faraday

Have a wonderful week.

Thank you
