DICTIONARY

Introduction

In almost every South African classroom you will find speakers of a number of different languages. Because of this, you may need to teach in a slightly different way to include all learners. Firstly, acknowledge that your learners may speak a number of different languages, and find out more about the home languages of each learner. Then, use the bilingual dictionary to help you as you teach mathematics.

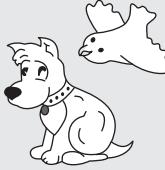

This bilingual dictionary includes the daily list of **lesson vocabulary** that is included in the lesson plans and the teacher's notes. In the dictionary you will find explanations and diagrams for the lesson vocabulary. It is structured in alphabetical order according to the English terms.

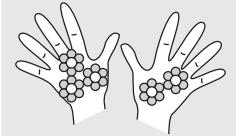

Lesson vocabulary is the important mathematical vocabulary that is used in the lesson. Please go through the lesson vocabulary as part of your lesson preparation. These terms are important as they are the language of mathematics that each learner needs to learn and understand, in order to build a solid foundation and understanding of this subject. It is important to explain these words to your learners, and to encourage learners to use them as well.

You should also use more than one language to explain the words if necessary – the dictionary will help you to do this. Many South African mathematics teachers already code-switch to help their learners understand mathematical concepts and terms. This means that they alternate between two or more languages when explaining mathematics. Research has shown that this is a very useful practice that does indeed help learners to understand. Code-switching allows teachers and learners to draw on all of their language skills to learn, rather than to be limited by one language only. This practice is now used internationally, and is also called 'translanguaging'.

If you have learners in your class who are not yet comfortable in the LoLT (Language of Teaching and Learning), try and explain the word in a language they understand. You can also use gestures or pictures to help you explain a concept. Another strategy is to let learners who speak the same language discuss the concept in their home language, and explain to each other.

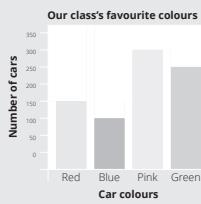

The revised CAPS Section 4 (Assessment) endorses the use of more than one language to speak mathematically.
